

Report 2 Contents

1. INTRODUCTION

You are required to submit a group report detailing the work you have carried out for your project so far. This report should focus on the design, implementation, and evaluation of your proposed approach, building upon the insights gained from your earlier literature review.

- You may briefly refer to key findings from Report 1 to motivate your problem formulation and design choices; however, this report should not repeat the literature review in detail.
- This report is a joint effort; therefore, please ensure effective collaboration within your group and clearly integrate contributions from all members.
- Your report needs to be submitted before the deadline stated in the ‘Assessment Tasks and Submission’ section of the module’s Moodle page (22 May 2026, 16:00).
- Submission should be made via the Moodle web page for COMP0225.

2. REQUIREMENTS FOR THE WRITTEN REPORT

- Please write your report in $\text{\LaTeX}$ using the IEEE Transactions template for your submission. You can find it via the following URL: [LATEX Template](#).
- The report length should be between 10 and 12 pages, **including figures, tables, and the bibliography**.
- The report should follow a clear academic writing style, with well-structured sections, appropriate use of figures and tables, and proper citation of relevant literature.
- Figures, diagrams, and tables are expected where appropriate, particularly to present system design, methodology, and experimental results clearly.

Just a reminder that UCL has a site license for students to use $\text{\LaTeX}$ through Overleaf, making it easy to get started and providing useful resources: <https://www.overleaf.com/edu/ucl>.

3. SUGGESTED REPORT STRUCTURE

The suggested structure for the report is as follows:

- 1) Abstract (a concise, self-contained summary of the project, including: (i) the problem addressed, (ii) the proposed approach, (iii) what has been implemented, and (iv) key results or observations; typically 150–200 words)
- 2) Introduction (background, problem definition, and a brief overview of the proposed approach and contributions. You may briefly build upon key conclusions from Report 1 to motivate the problem and design choices; however, the ‘Introduction’ section should remain concise and should not repeat the literature review in detail)
- 3) Project Management (expected milestones and timeline **for the whole duration** of the project, tasks and objectives, roles and responsibilities, risks and mitigation strategies; approximately 1 page)
- 4) Methodology and System Design (description of the proposed approach, system architecture, models/algorithms used, and implementation details; justification of design choices with reference to relevant literature where appropriate)
- 5) Experimental Setup (description of datasets, simulation environments, evaluation metrics, and baseline methods, where applicable; CAD models, pictures of hardware setup and/or components, and so on)
- 6) Results and Discussion (presentation of experimental results using figures and tables; analysis and interpretation of results; comparison with expectations or existing approaches; discussion of strengths, limitations, and observed challenges)

- 7) Conclusions (summary of work completed, major challenges encountered, key technical and practical insights gained, initial research findings, and reflection on limitations and lessons learned; approximately 1 page)
- 8) Bibliography (10–30 references; any standard bibliography style may be used)

4. MISCELLANEOUS

Your intended audience should be someone at the level of a UCL CS graduate. You should adjust your explanations accordingly.

Remember to do the following when preparing your report:

- clearly explain and motivate your problem and objectives;
- ensure that your report has a clear and logical narrative;
- clearly describe your methodology, system design, and implementation;
- present experimental results effectively using figures and tables where appropriate;
- critically analyse and interpret your results, rather than only describing them;
- discuss strengths, limitations, and challenges of your approach;
- support your design choices and analysis with appropriate references where needed;
- structure your report to help the reader navigate the material easily;
- ensure that the report is coherent and well-presented throughout;
- ensure that there are clear take-away messages.
